Atypical Nevus Screening Questionnaire (ANQ)

On a recent HPFS questionnaire, you reported having an **atypical nevus** (atypical/dysplastic mole). An atypical nevus/mole is a type of nevus/mole that looks different from a common nevus/mole and is often larger with borders that are **not easy** to see. Its color is usually uneven and can range from pink to dark brown. Parts of the nevus may be raised above the skin surface. **An atypical nevus is NOT a melanoma or other skin cancer.**

1. Have you ever had an atypical nevus diagnosed?
   - [ ] No
   - [ ] Yes
   
   *If No, please stop here, if Yes please continue.*

2. Who made this diagnosis?
   - [ ] Dermatologist
   - [ ] Other physician

3. Which calendar year were you **first diagnosed** with an atypical nevus (please provide a best estimate)?

4. Have any of the following biological relatives had an atypical nevus diagnosis?
   - [ ] No
   - [ ] Yes
     - [ ] Parent
     - [ ] Sibling
     - [ ] Offspring

5. Did you ever have an atypical nevus diagnosed by biopsy or another surgical procedure?
   - [ ] No
   - [ ] Yes
   
   *If No, please stop here, if Yes please continue.*

6. Which calendar year did you have the first atypical nevus **surgically removed** (please provide a best estimate)?

7. How many atypical nevi were removed IN TOTAL until now:
   - [ ] 1
   - [ ] 2–4
   - [ ] 5–10
   - [ ] 11+
   - [ ] Unknown

8. Was there ever a need to surgically remove more tissue (i.e., re-excision) from the nevus removal site after the pathology results were available (for a lesion that was NOT melanoma or other skin cancer)?
   - [ ] No
   - [ ] Yes
